

HTTP Method

POST

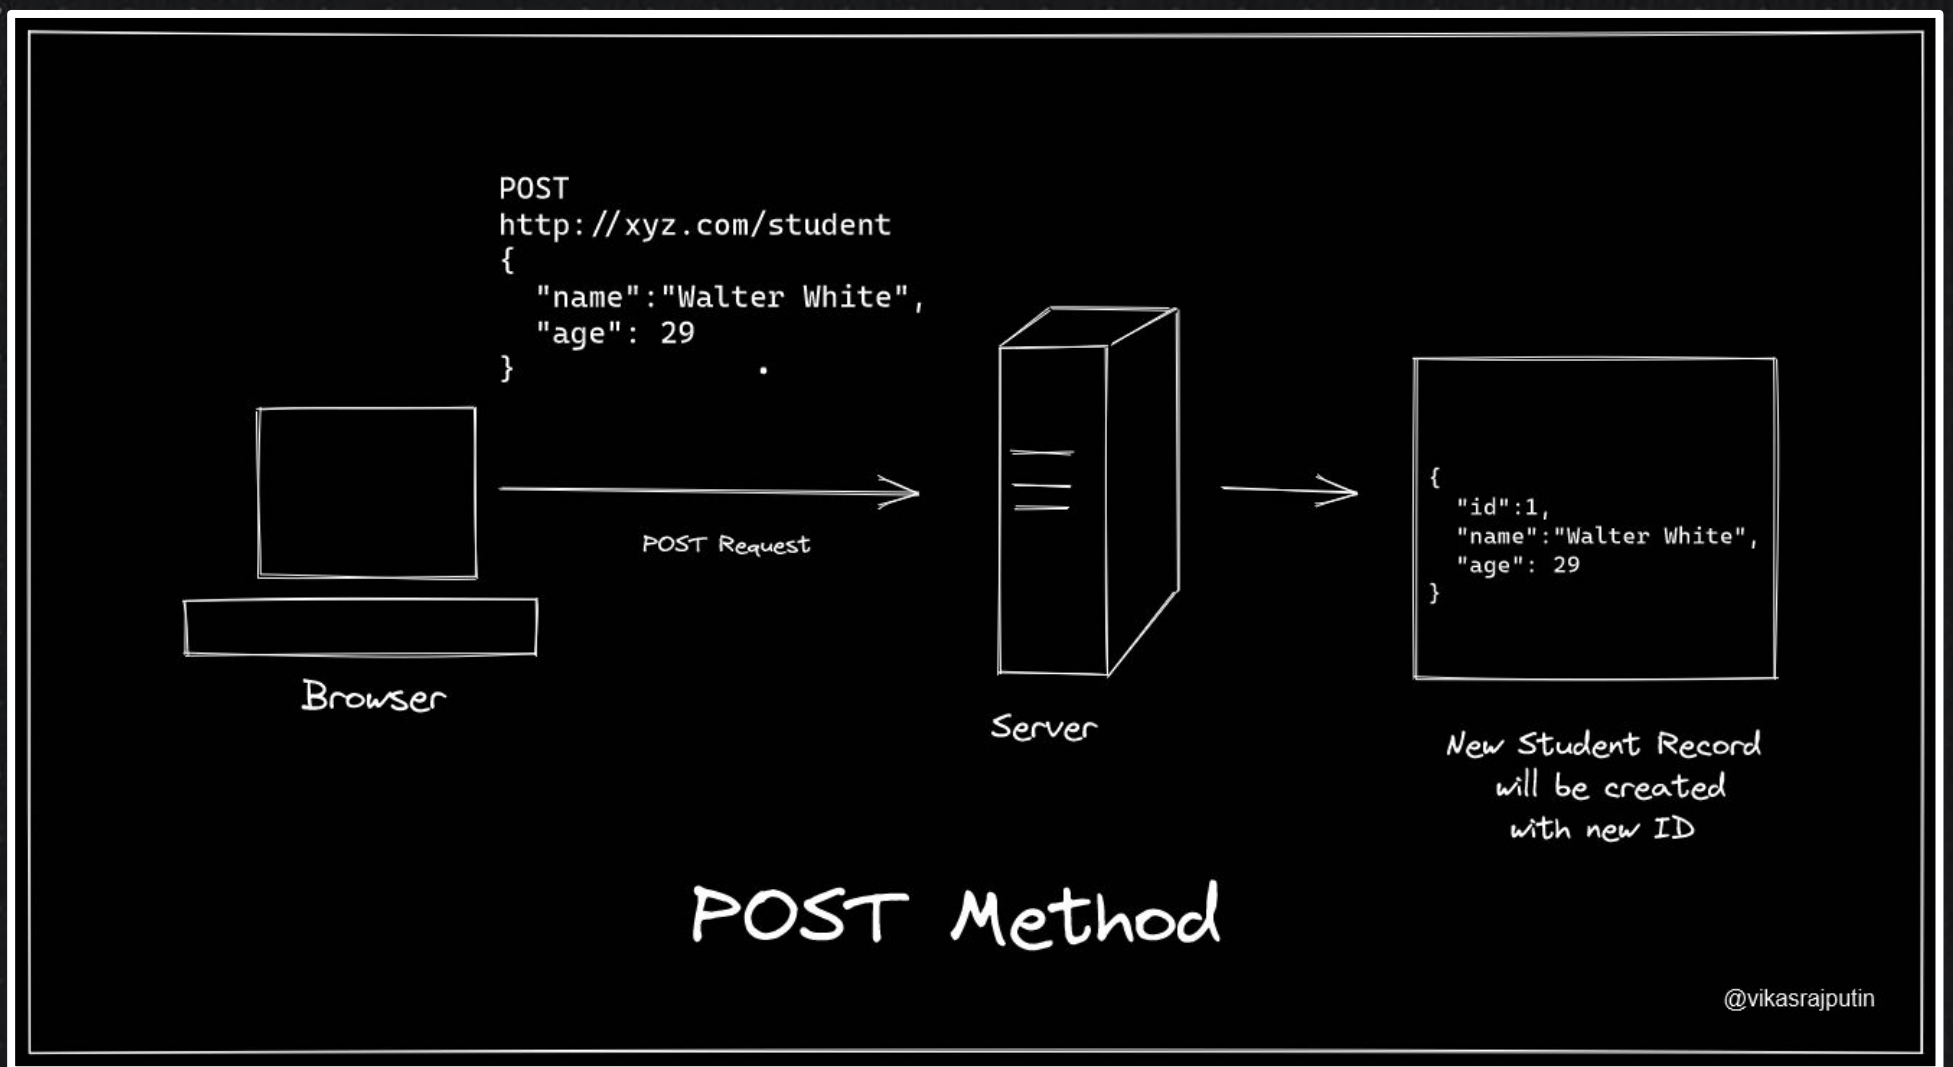

@vikasrajputin

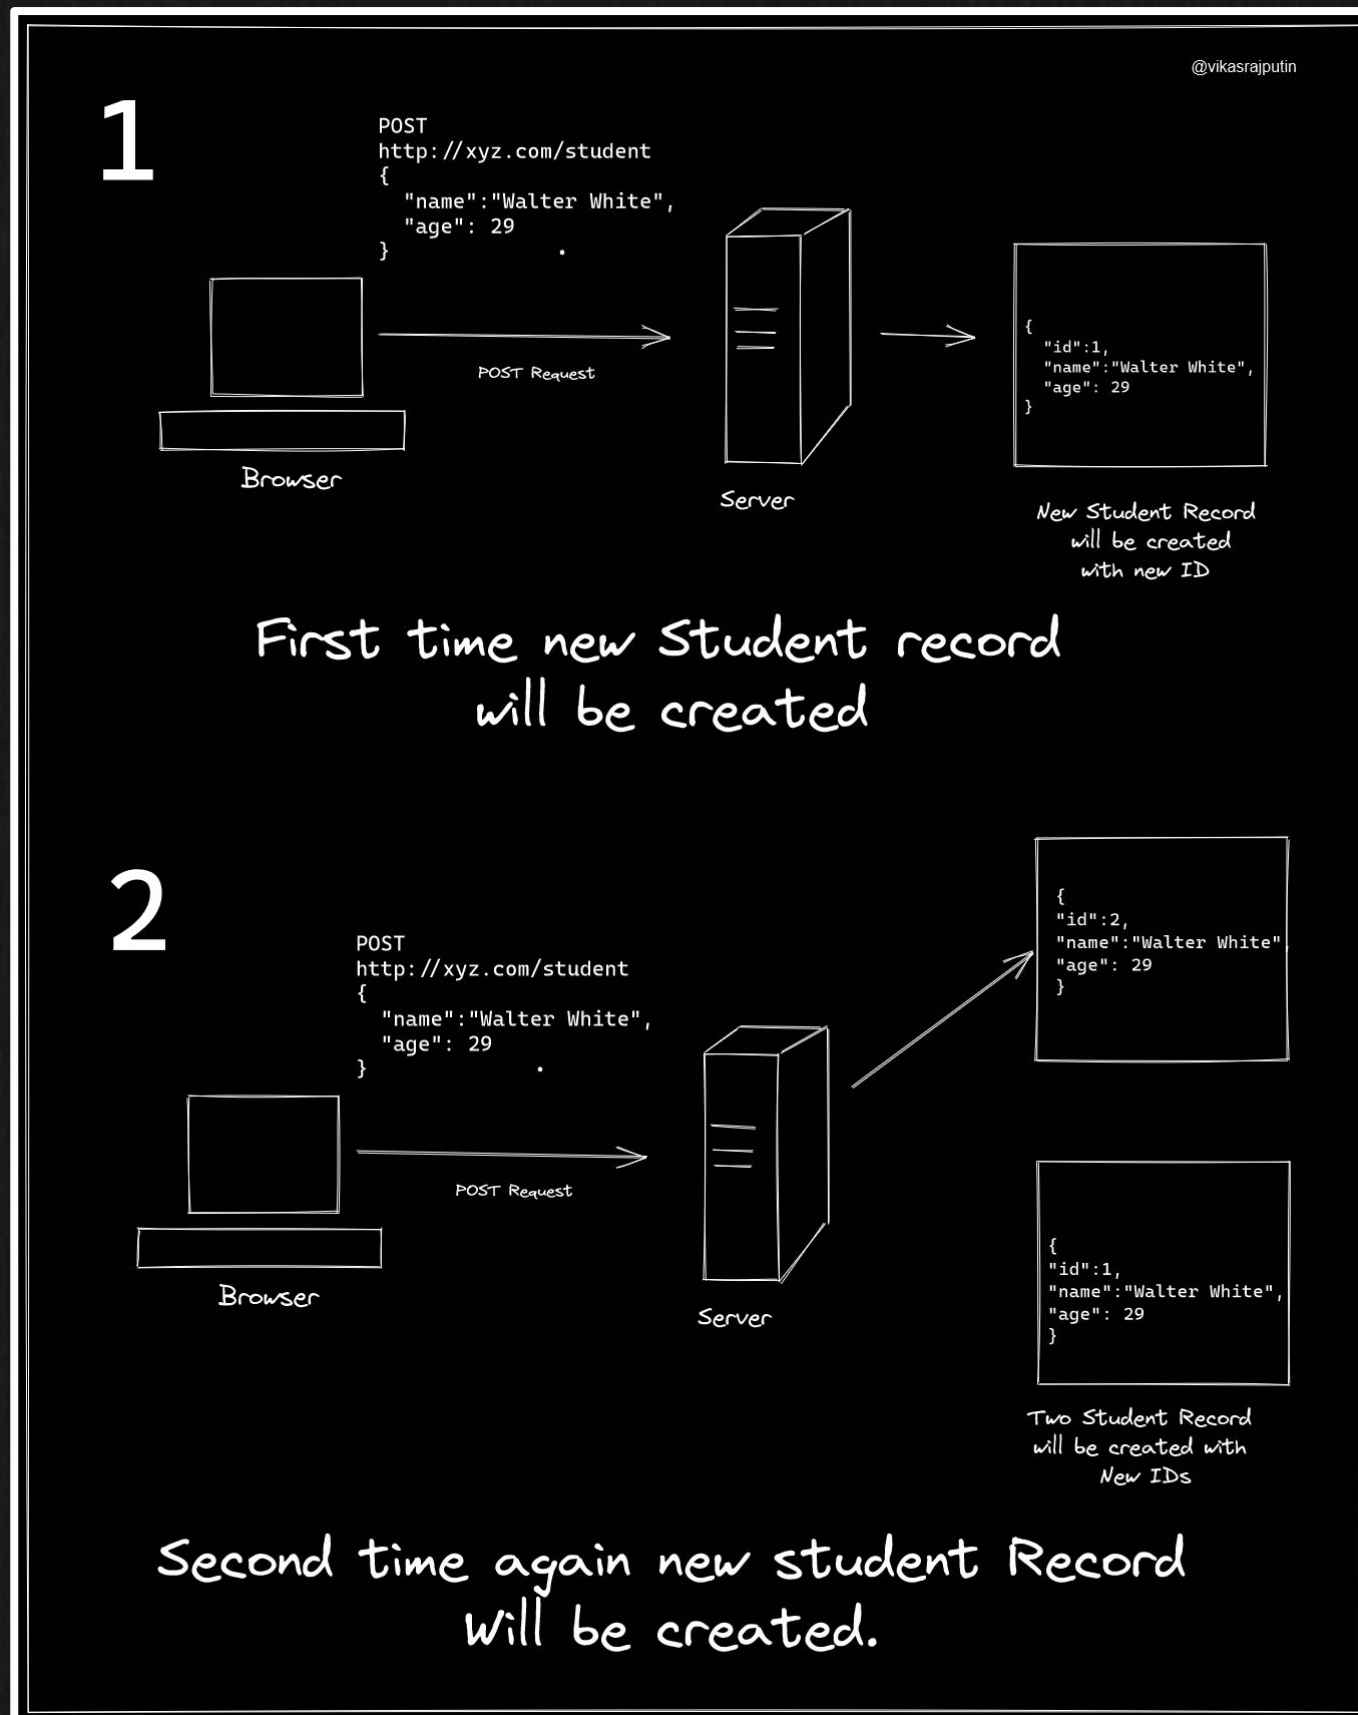

1. POST

- It's used when we want to create a new resource on the server.
- It's Non-Idempotent - If executed multiple times it gives different results.

→ Eg: POST API to register a new student will create a new student record in the server as shown below:

→ Eg: Accidently, calling POST API multiple times will create a new student record every time with the same information. In the end, we will end up with duplicate records:
