You are missing these

JavaScript tricks!

Swipe Next →

01

Turn an if...else to a One-Liner

Commonly if-else statements look like this:

```
if (1 < 2) {  
  console.log("True.");  
} else {  
  console.log("False");  
}
```

But there is a neater way to achieve the same with a ternary operator:

```
1 < 2 ? console.log("True.") :  
console.log("False.");
```

Swipe 

02

The Spread Operator

```
const numbers = [1, 2, 3, 4];  
const allNumbers = [...numbers, 5, 6, 7, 8];  
// allNumbers = [1, 2, 3, 4, 5, 6, 7, 8]
```

Swipe ➡

03

An Array of Unique Values

```
const numbers = [1, 1, 2, 3, 5, 5, 1];  
const uniqueNumbers = [...new Set(numbers)];  
console.log(uniqueNumbers); // Result: [1, 2,  
3, 5]
```

04

Convert a Number to a String

JS

```
const num = 1 + "";  
console.log(typeof num); // "string"  
console.log(num); // "1"
```

Swipe 

05

Convert a String to a Number

```
const numStr = "84";  
const num = +numStr;  
console.log(typeof num); // "number"  
console.log(num); // 84
```

Swipe 

06

Strings on Steroids

Embed a variable in-between a string

JS

```
const name = 'Charlie';  
const greeting = `Good day, ${name}.`;   
console.log(greeting); // "Good day,  
Charlie."
```

Swipe ➡

07

Swap Two Variables Without a Third

```
let x = 1;  
let y = 2;  
[x, y] = [y, x]; // x = 2, y = 1
```
