INTRODUCTION

BOOTSTRAP

Bootstrap is what I'd call a **Component-based Framework**. It's designed to help developers quickly bootstrap a typical website or app and so comes with a set of **pre-made components**, along with some **utilities for spacing etc.**

TAILWIND CSS

TailwindCSS is a **Utility-first Framework**. In contrast to Bootstrap, which provides a few utilities, **Tailwind is all utilities**. The core framework has **no pre-made components**, so you'll need to **build your own**.

Let's Compare

PROS OF USING

PROS OF BOOTSTRAP

- ♠ Responsiveness
- ♠ UI components
- ♠ Consistent
- ♠ Great docs
- ♠ Flexible

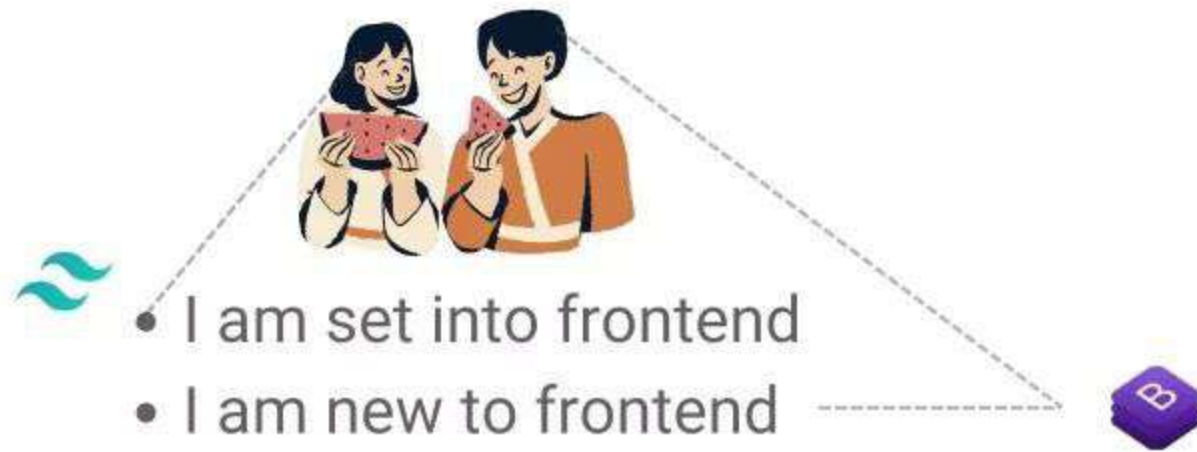

PROS OF TAILWIND CSS

- ♠ Quick Setup
- ♠ Highly Customizable
- ♠ Utility first styles
- ♠ Great docs
- ♠ Versatile

IF YOU'RE SET ON THE **FRONTEND** PATH

If you're set on the **frontend path** or are more seasoned with CSS, then **Tailwind** (or maybe even no framework) is a good choice, seeing as you'll need to get **good with CSS anyway**.

IF YOU'RE A NEW "BACKEND" OR "FULL-STACK" DEVELOPER

I'd highly recommend trying **Bootstrap** first - make use of their built-in components, and only pick up **CSS** as **needed** when tweaking the styles or starting your **own components**.
