

Easy Steps

How Scrum Works?

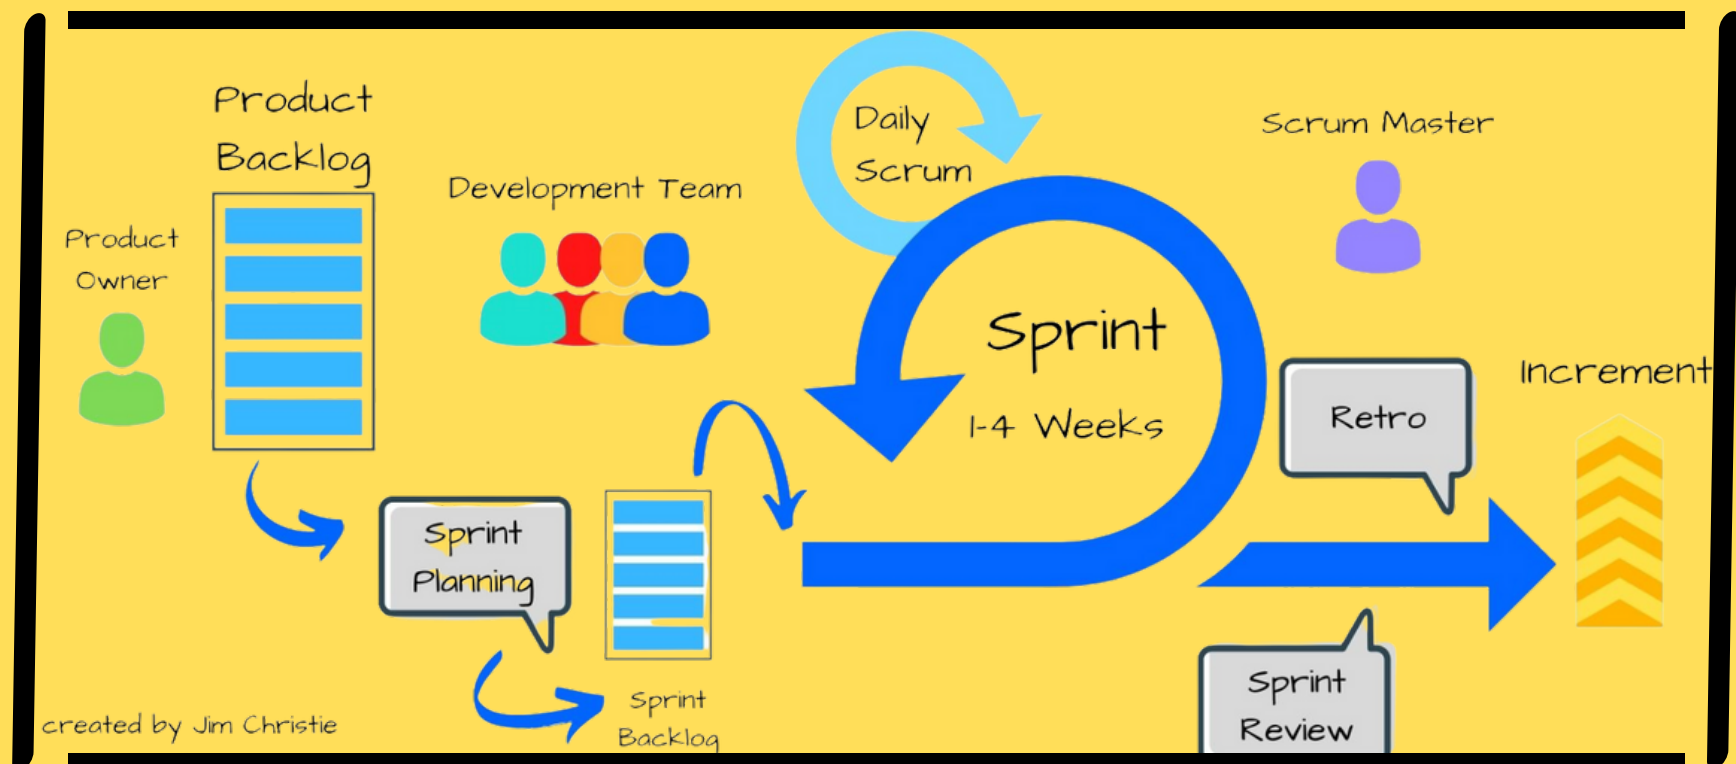

If you're new to Scrum it can be confusing to understand how it works

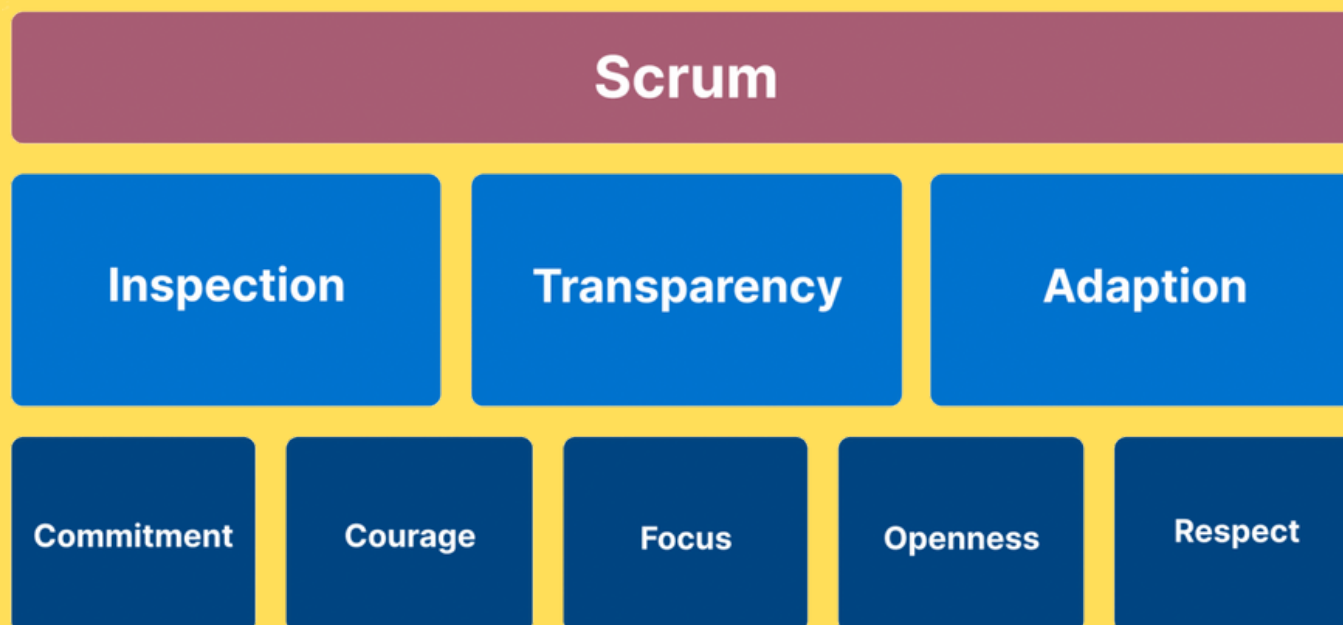

let's start with the basics

Scrum is a framework for managing projects and is widely used in software development

Scrum is based on three core principles

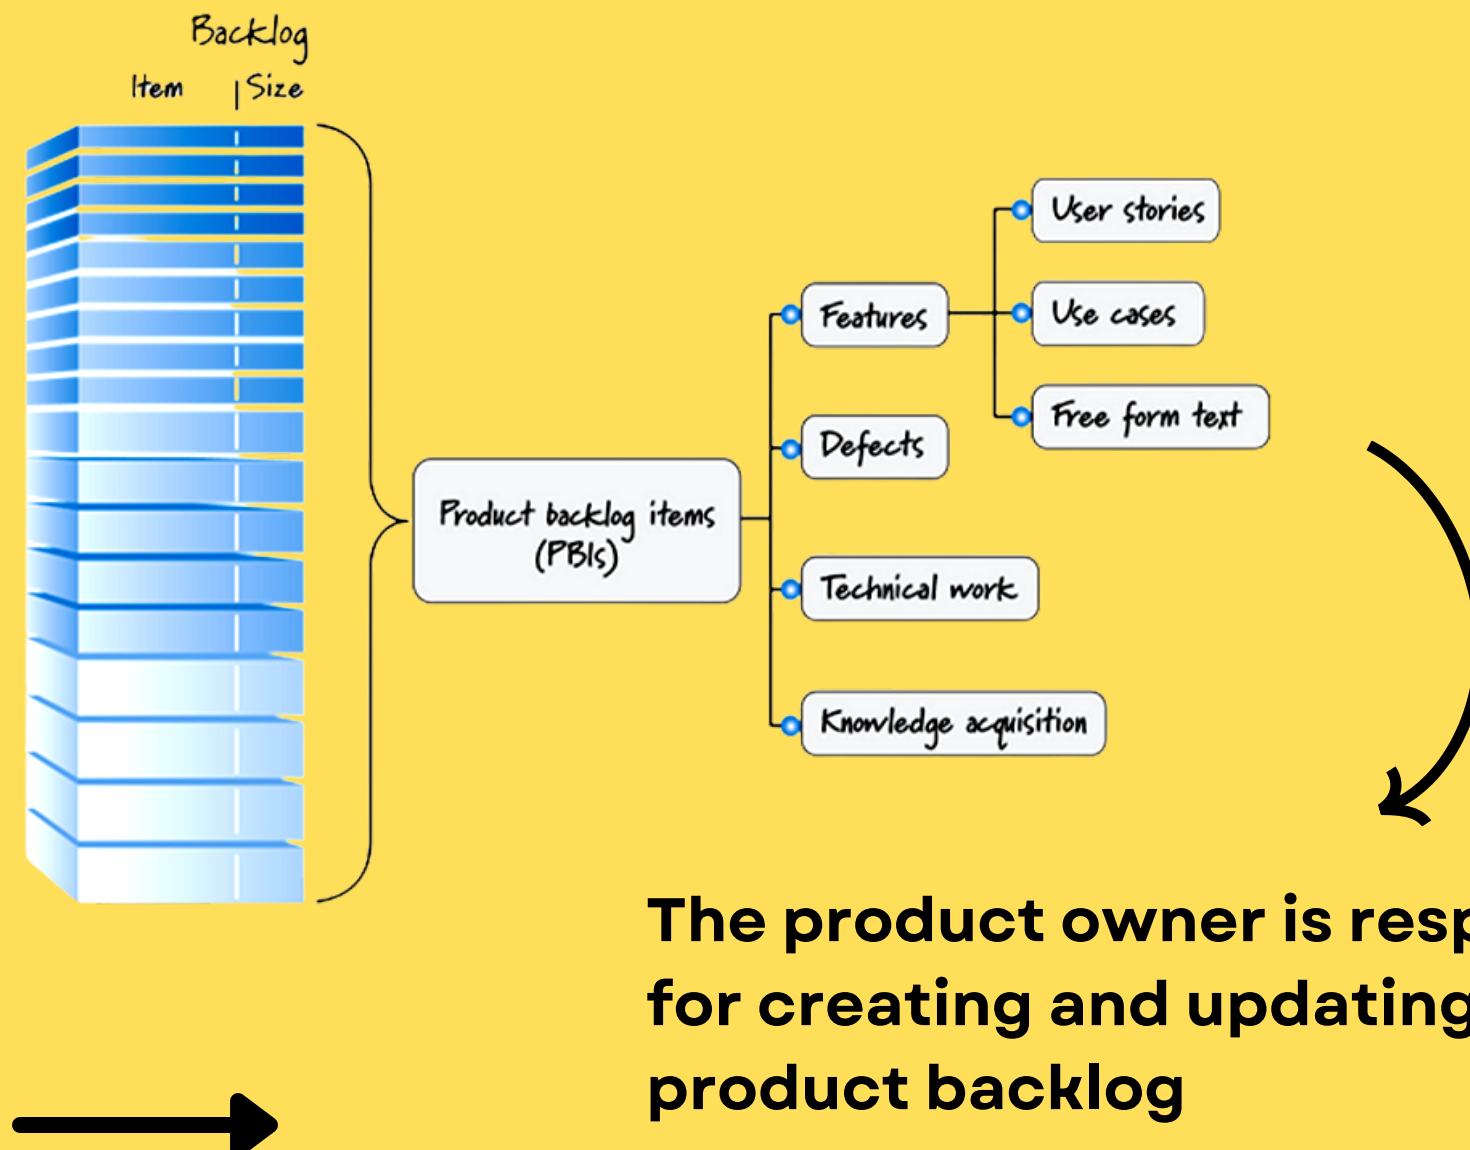

These principles work together to help teams be more productive and efficient

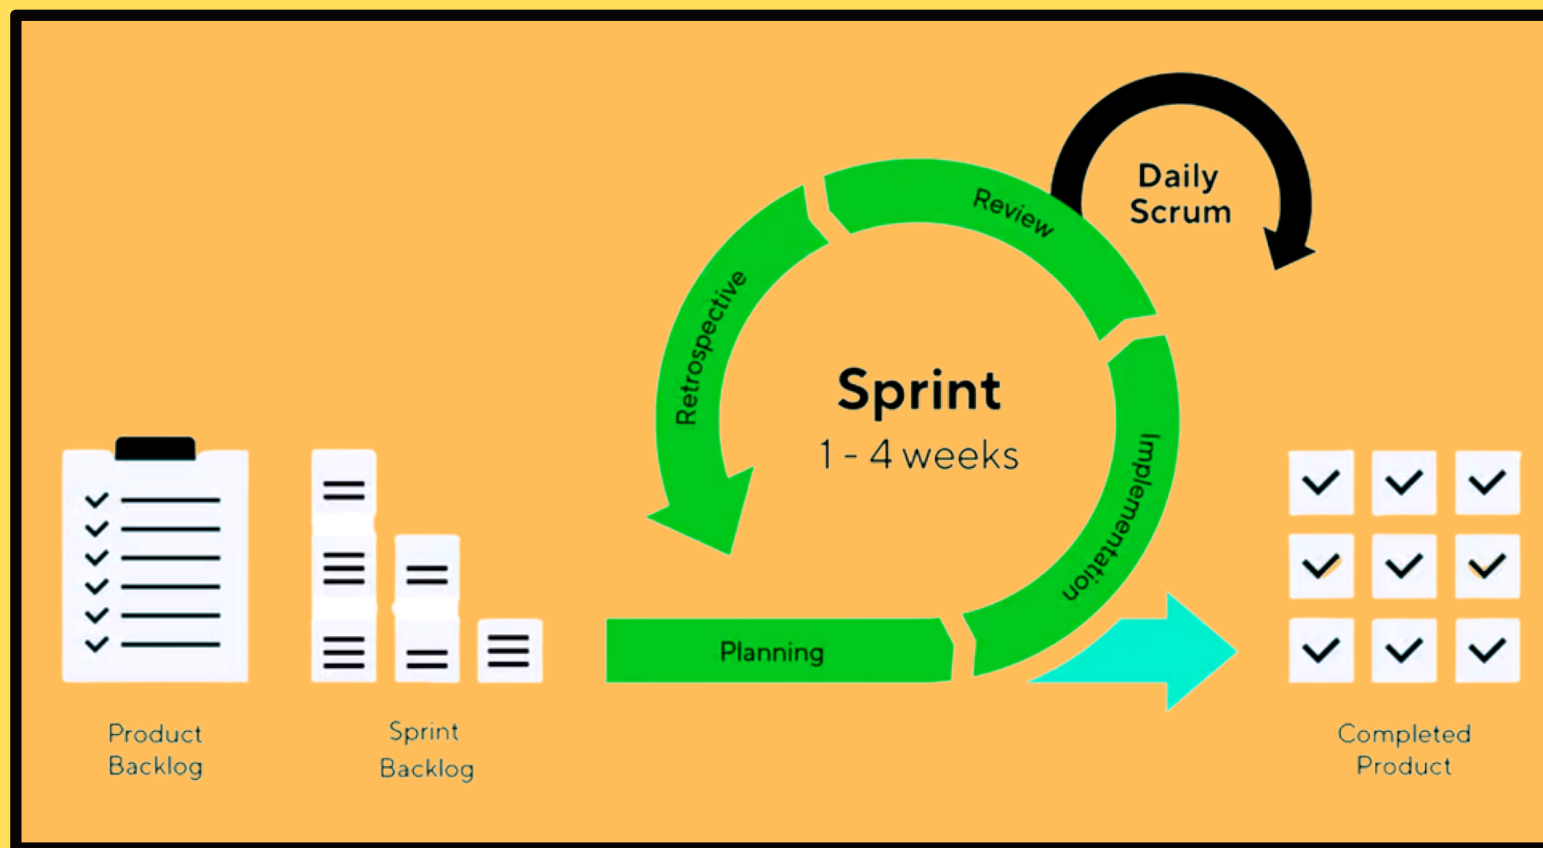

The first step

Is to create a product backlog this is a list of all the features and tasks needed to achieve the project's goal

The next step

Is to create a sprint backlog this list of tasks will be completed during the current sprint

The team decides which tasks should be included in the sprint backlog

The team then meets to plan the sprint

They decide how much work they can complete in the given period and choose which tasks should be completed first

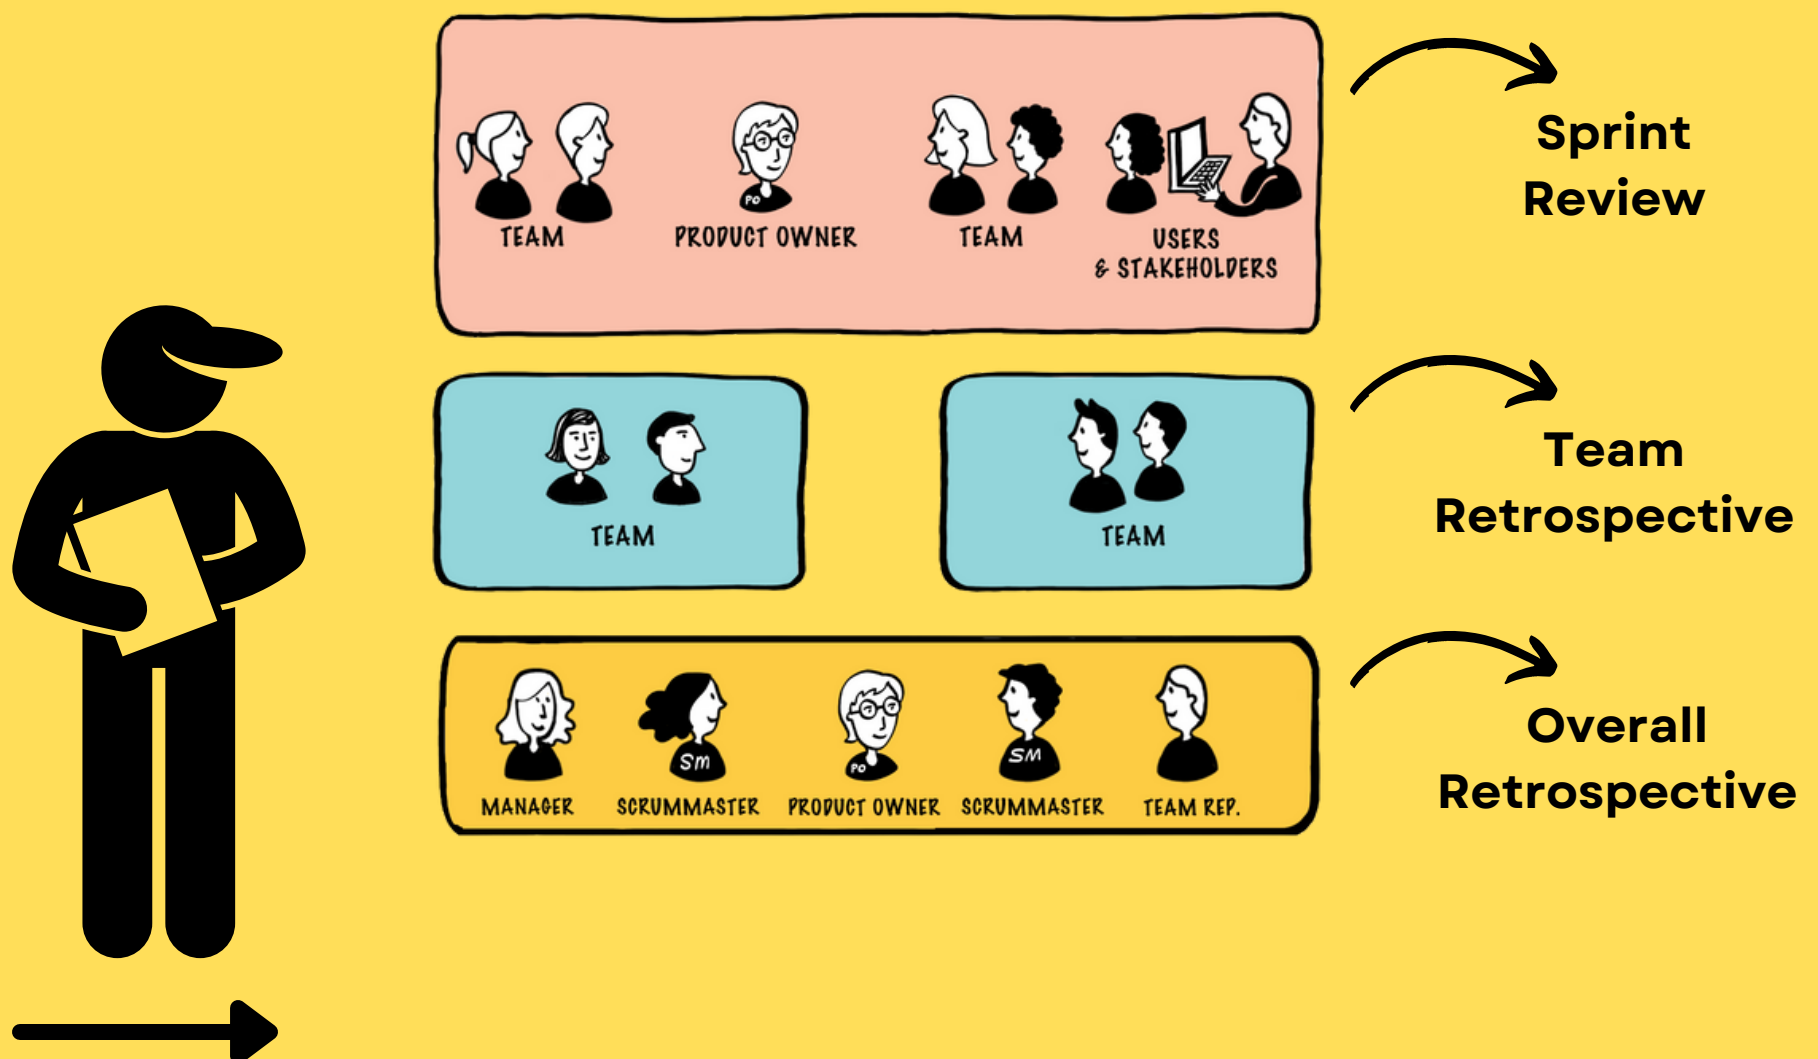

The team then starts working on the tasks in the sprint backlog

They track their progress and update the sprint backlog as they go.

At the end of the sprint

They review what was accomplished and decide what should be included in the next sprint backlog
