

Angular 15 features

1

Build applications without using modules

Standalone components are now stable.

You can now build applications in Angular without using modules. They provide a **simplified way** to build Angular applications.

Swipe →

2

HTTP support has evolved

It's now possible to provide the HttpClient using `provideHttpClient()`.

Swipe →

3

Improved download time for images

The `NgOptimizedImage` directive is now stable.

You can use it to optimize images. Adding `NgOptimizedImage` to your component or `NgModule` can help reduce the download time of images in your Angular application.

4

DATE_PIPE_DEFAULT_TIMEZONE token is deprecated

It's now replaced with DATE_PIPE_DEFAULT_OPTIONS which **accepts an object**. The object has a timezone property and a dateFormat property to specify the default date format that the pipe should use.

New utility packages are added in forms

`isFormControl`, `isFormGroup`,
`isFormRecord`, and `isFormArray` are
some of the utility packages that
have been added to the forms
package.

Directives can be added to host elements

The directive composition API makes it possible to add directives to host elements. The Directives let you **add behaviours to the behaviour of your component** without using inheritance.

Do you find it helpful?

let me know down in the
comments !
