PART - 1

CSS FLEXBOX SERIES
(FLEXBOX TERMINOLOGIES)

CSS Flexbox

CSS flexbox is the most widely used layout method.

It is a one-dimensional layout method for arranging items in rows or columns.

CSS Flexbox

For simplicity, I have divided the topic into three parts:

1. Flexbox Terminologis

2. Flexbox Containers (parents)

3. Flex Items (children)

CSS Flexbox

This flex container contains flex items, which will be arranged as per parent property.

Let me show you the flexbox model, which will help you to understand this better.
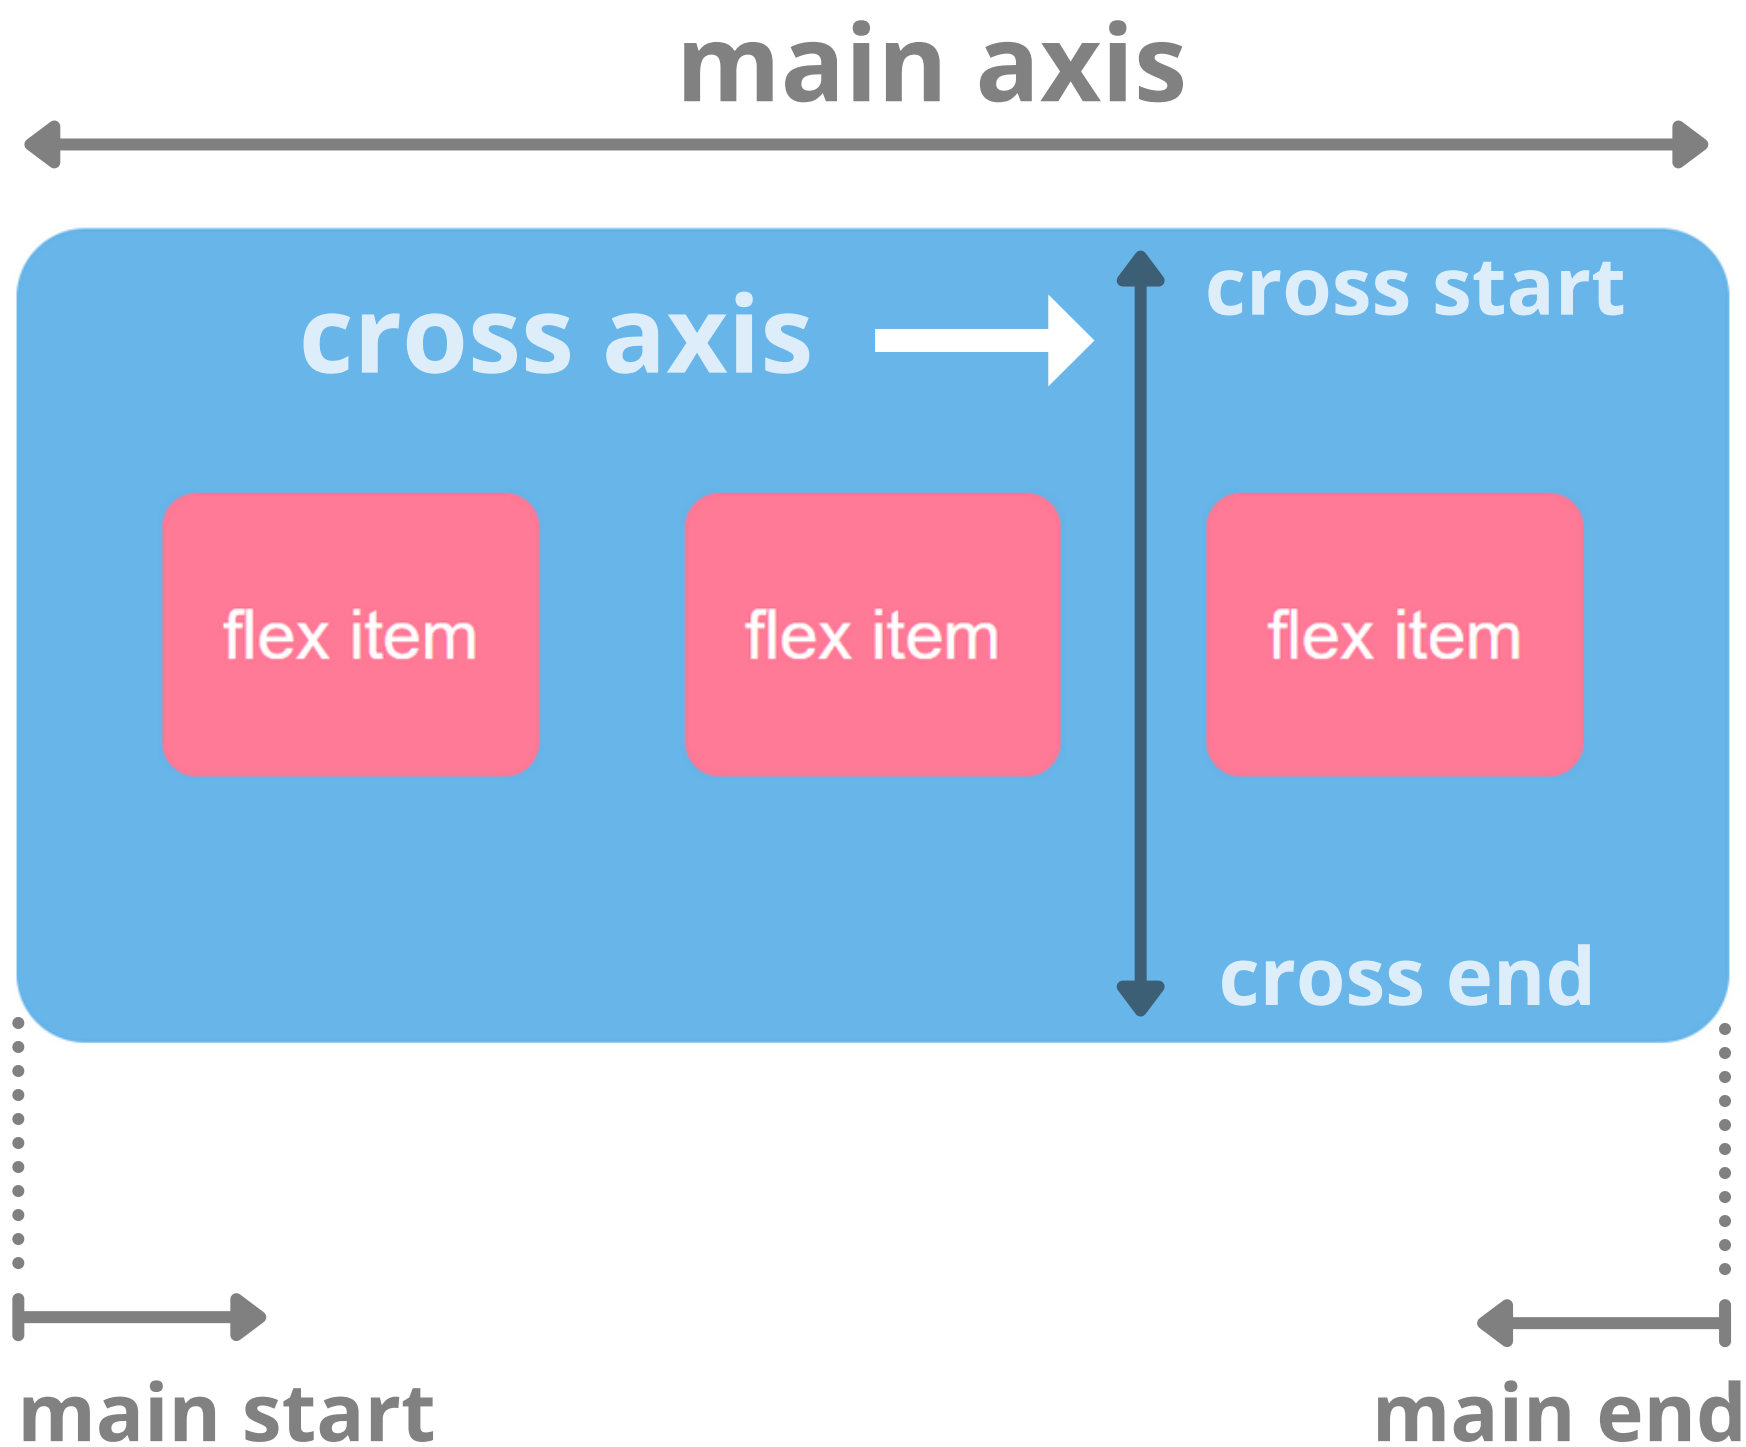

- main-axis: This is the axis along the flex-items. It changes with direction (row/column).
- cross-axis: This is the axis perpendicular to the flex-item direction.

CSS Flexbox Guide

main axis

cross axis →   cross start

flex item   flex item   flex item

cross end

main start   **main end**
